I am trying to find the effective crack diameter (d) and K-value of the fractures. for the specific case of a rectangular prism with the base area of 20 cm and height of 8 cm. It looks like the crack depth should be 8 cm, but I am uncertain if there is a crack width. A: A general approach to calculating fracture permeability is to assume a constant crack length and a uniform crack spacing in the face plane of the prism. Then, you can calculate the fracture permeability as a function of the fracture length, the depth of the fracture, and the crack angle from the face plane. For a prism, the corresponding expression in terms of the crack length, the crack depth, and the crack angle is  $\phi = \tan^{-1}\left(\frac{d}{L}\right)$   $\frac{\phi}{2} = \sin\left(\frac{\phi}{2}\right)$   $\tan\left(\frac{\phi}{2}\right) = \frac{d}{L}$   $\phi = 2\sin^{-1}\left(\frac{d}{L}\right)$   $\frac{r_i}{r_o} = \frac{L}{2}$   $\frac{r_f}{r_o} = \frac{L}{\pi}$   $L = r_f \times \pi$   $L_{cr} = 2\pi r_f$   $\text{K} = \frac{\dot{Q}}{\text{A}} \times L_{cr}^{\epsilon}$  In the last step, I took the geometrical average of the ratios of crack length and length to height. Since the crack length is the same as the cross-sectional area of the prism, and there are four parallel sides, the area to which the area ratio applies is  $\text{A} = \frac{4}{\sin(\phi/2)} \times \text{A}_f$   $\text{A} = 4 \times \text{A}_f = 4 \times L_f$   $\text{A} = 4r_f^2$
